Data Science Ethics

The movement to hold AI accountable gains more steam

First-in-US NYC law requires algorithms used in hiring to be “audited” for bias.

- Photo ID software works well for white men—black women, [not so much](#)

Data Science Ethics

Aspects of ethics include...

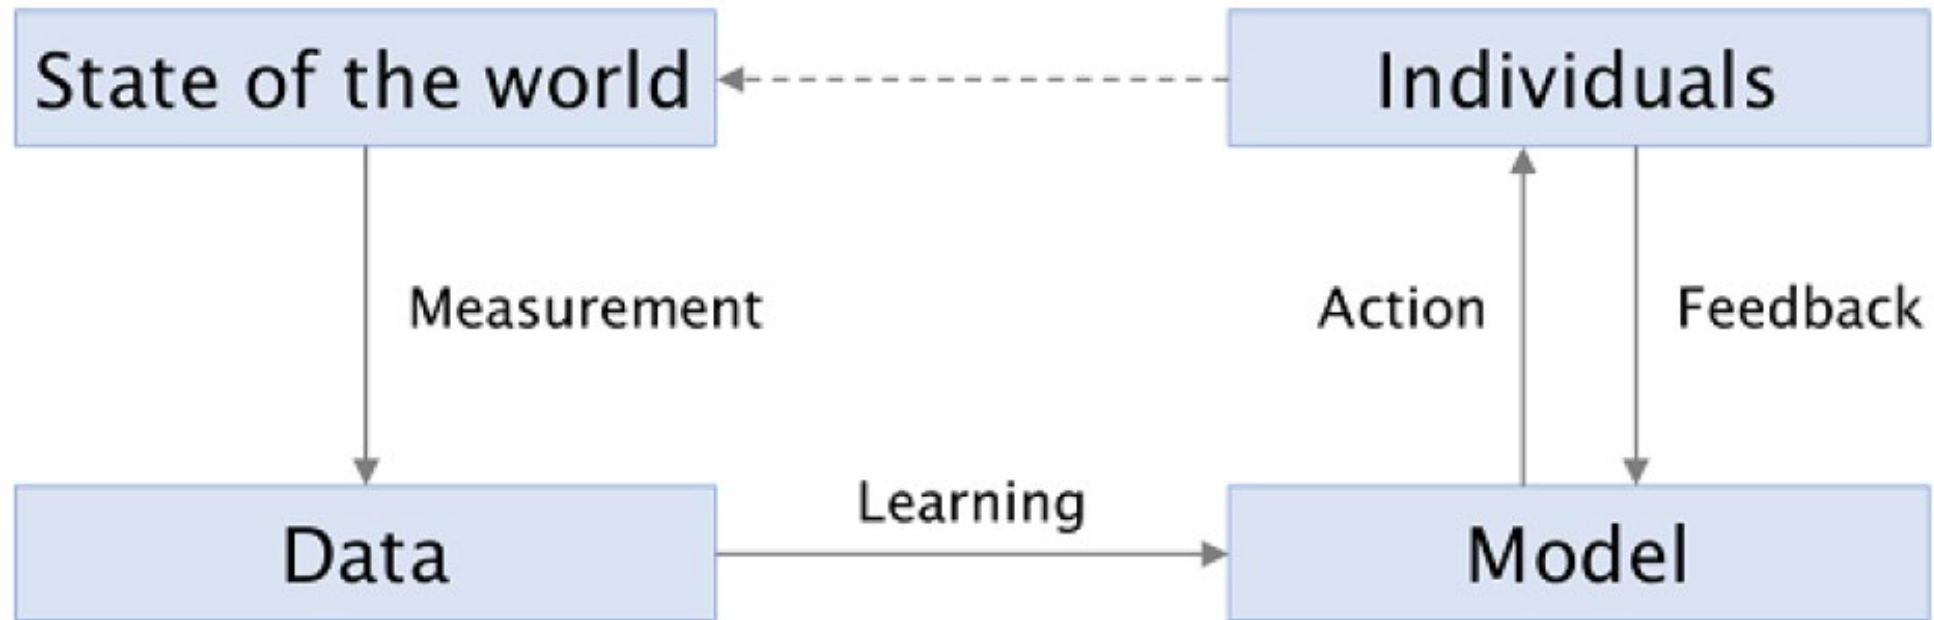

Security Who has access to the data?

Privacy Can data be used to identify individuals?

Fairness Are predictions biased across groups?

Transparency Do users know what they are consenting to? Are model decisions interpretable?

Impacts of Data Science

It is rare for data science to *not* involve people in some way

- Of the top 30 recent Kaggle competitions, 14 involve making decisions that directly affect people
- An additional 5 have obvious indirect affect on people
- Only 9 had no obvious impact on people

Data Science Fairness

Fairness issues can arise from biases in the data...

- Are there observable biases in the data?
- Can we correct for them?

- Differences in the distributions of training / test data?
- Can we detect these differences and avoid / correct them?

Training data reflect disparities, distortions, and biases from the real world and measurement process...

For each model a data scientist should ask... Does learning the model preserve, mitigate, or exacerbate these disparities?

Example Machine translation “She is a doctor” reverse translates to “He is a doctor” in many languages due to data biases.

Data Science Ethics

A real-live example of dataset bias...

<https://translate.google.com/>

Exhibits gender bias in many languages...

...largely the result of using highly-parameterized neural networks with inadequate training data

Assessing Gender Bias in Machine Translation – A Case Study with Google Translate

Abstract

Recently there has been a growing concern in academia, industrial research labs and the mainstream commercial media about the phenomenon dubbed as *machine bias*, where trained statistical models – unbeknownst to their creators – grow to reflect controversial societal asymmetries, such as gender or racial bias. A significant number of Artificial Intelligence tools have recently been suggested to be harmfully biased towards some minority, with reports of racist criminal behavior predictors, Apple’s iPhone X failing to differentiate between two distinct Asian people and the now infamous case of Google photos’ mistakenly classifying black people as gorillas. Although a systematic study of such biases can be difficult, we believe that automated translation tools can be exploited through gender neutral languages to yield a window into the phenomenon of gender bias in AI.

In this paper, we start with a comprehensive list of job positions from the U.S. Bureau of Labor Statistics (BLS) and used it in order to build sentences in constructions like “He/She is an Engineer” (where “Engineer” is replaced by the job position of interest) in 12 different gender neutral languages such as Hungarian, Chinese, Yoruba, and several others. We translate these sentences into English using the Google Translate API, and collect statistics about the frequency of female, male and gender-neutral pronouns in the

Data Science Fairness

Example We are building a system to screen mortgage applications. Suppose we collect training data from two demographic groups: 85% White and 15% Black

- Predictive accuracy on the held-out validation set is 95%
- Only 5% error
- Should we sign off on the system as good?

With 5% total error can have up to 66% error on the underrepresented group. Need to report error by each group and aim for 95% accuracy in any group.

Data Science Fairness

Example You are building a system for college admissions based on GPA and interview score (obviously a toy example)

- Fit a least squares regression model
- Model does not account for two demographic groups (blue / green)
- Does this make it fair? (fairness-as-blindness)

Admission rate much lower for blue cohort

Data Science Fairness

How to address this behavior?

- GPA correlates with group—omit it as a predictor?
 - Would dramatically impact accuracy
- Pick separate cutoffs (fit separate model) for each group
 - No longer blind to demographics
 - What is the goal for picking cutoffs? Same admission rates?
- Could optimize for diversity among selected candidates
 - Measuring similarity is non-trivial

Classification Fairness Criteria

Let A be a sensitive attribute, target variable Y , and classifier prediction R .

Example In our admissions case,

A : Demographic group

R : Prediction of admission

Y : Actual acceptance outcome

Classification Fairness Criteria

Independence	Separation	Sufficiency
$R \perp A$	$R \perp A \mid Y$	$Y \perp A \mid R$

Independence The prediction and attribute are independent

Example The probability of predicting admission doesn't differ across demographic groups,

$$P(R \mid A = a) = P(R \mid A = b)$$

Demographic parity, statistical parity, group fairness, disparate impact

Classification Fairness Criteria

Independence	Separation	Sufficiency
$R \perp A$	$R \perp A \mid Y$	$Y \perp A \mid R$

Separation Score and attribute are conditionally independent, given the classifier decision

Example There is no relationship between prediction and attribute within accepted / non-accepted groups,

$$P(R \mid Y = 1, A = a) = P(R \mid Y = 1, A = b)$$

$$P(R \mid Y = 0, A = a) = P(R \mid Y = 0, A = b)$$

Classification Fairness Criteria

Independence	Separation	Sufficiency
$R \perp A$	$R \perp A \mid Y$	$Y \perp A \mid R$

Sufficiency Outcome and attribute are independent given the model prediction

Example There is no relationship between whether someone is admitted and their demographic group within predictions

$$P(Y \mid R = 1, A = a) = P(Y \mid R = 1, A = b)$$

$$P(Y \mid R = 0, A = a) = P(Y \mid R = 0, A = b)$$

Data Science Fairness

In short... there is a lot to say on ethics and fairness... and much can be quantified rigorously...

FAIRNESS AND MACHINE LEARNING

Limitations and Opportunities

Outline

- Data Science Ethics and Fairness
- **Course Recap**
- Additional Resources
- Final Exam Overview

What is “Data Science”?

My Definition: *The process of using data to answer questions, extract knowledge, and predict future outcomes.*

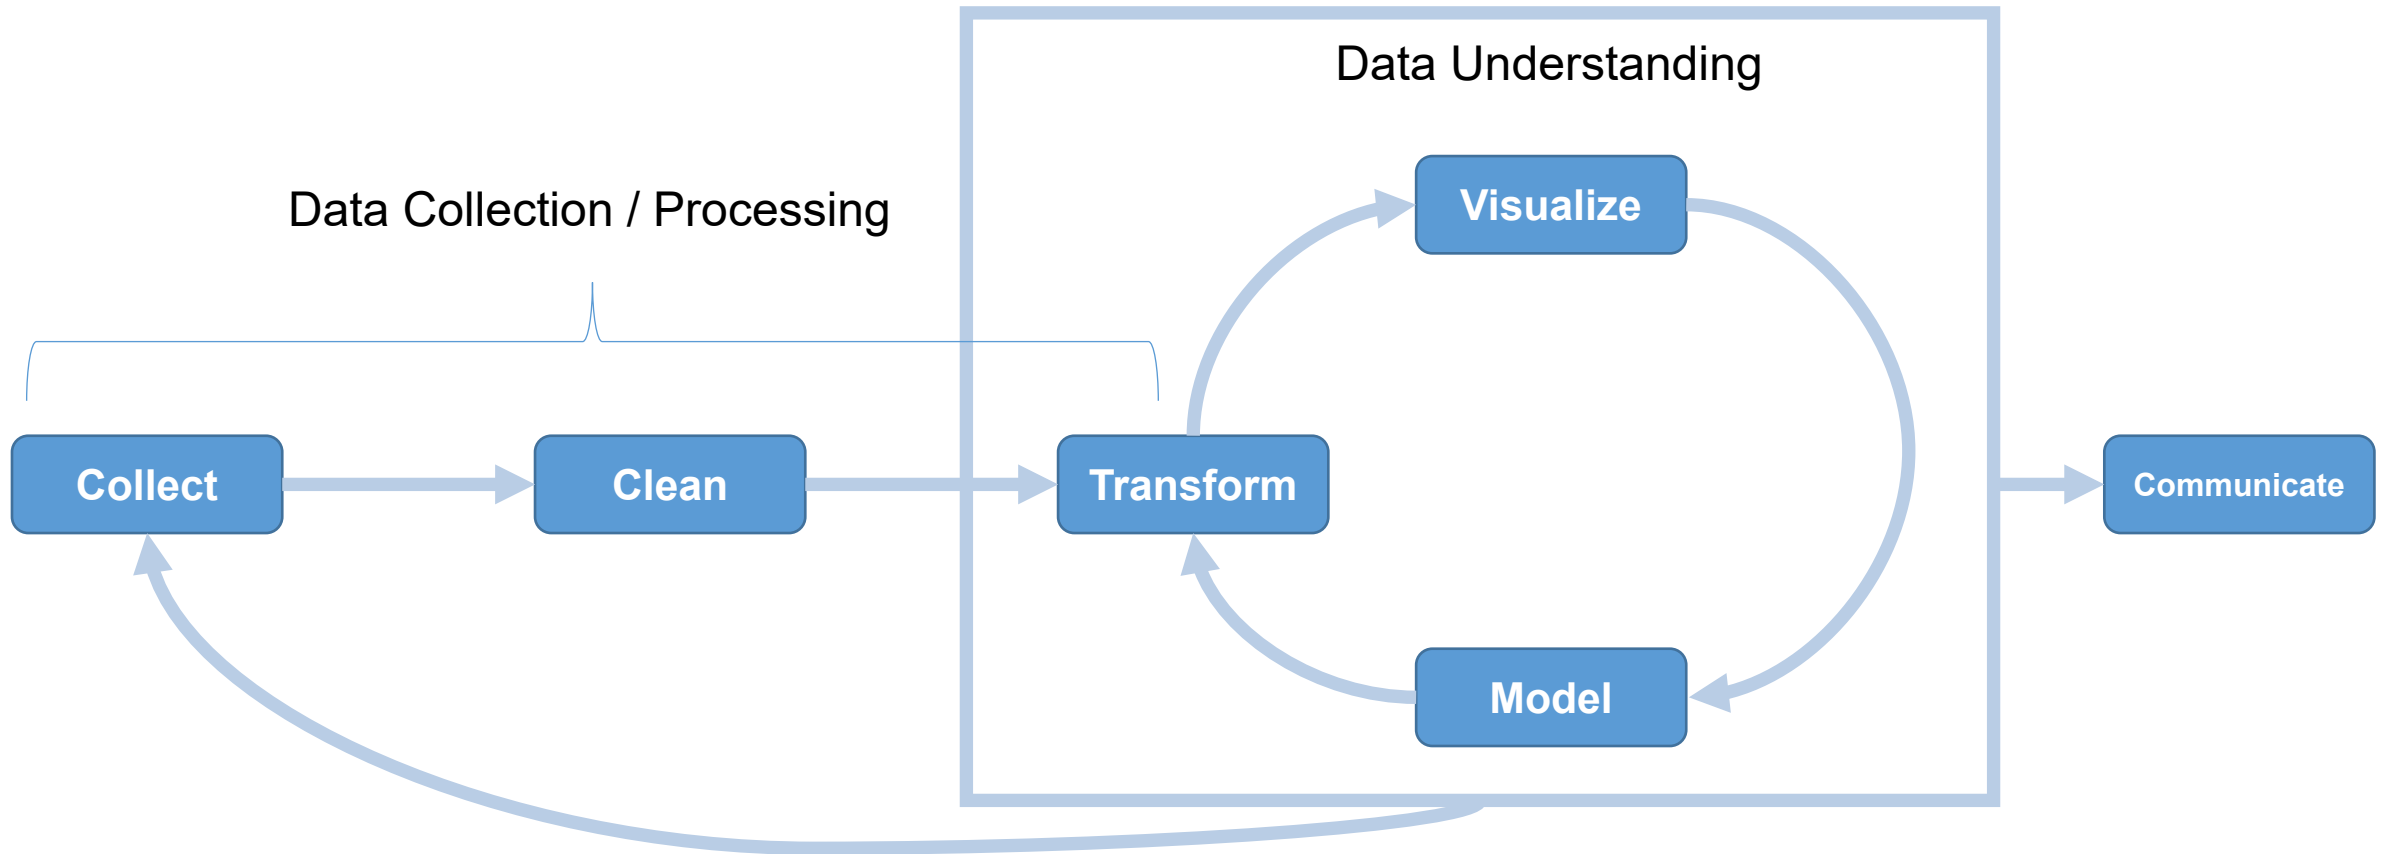

Caveat: I don't *love* this figure since it leaves out **visualization**.

[Source: [Robinson, E. and Nolis, J.](#)]

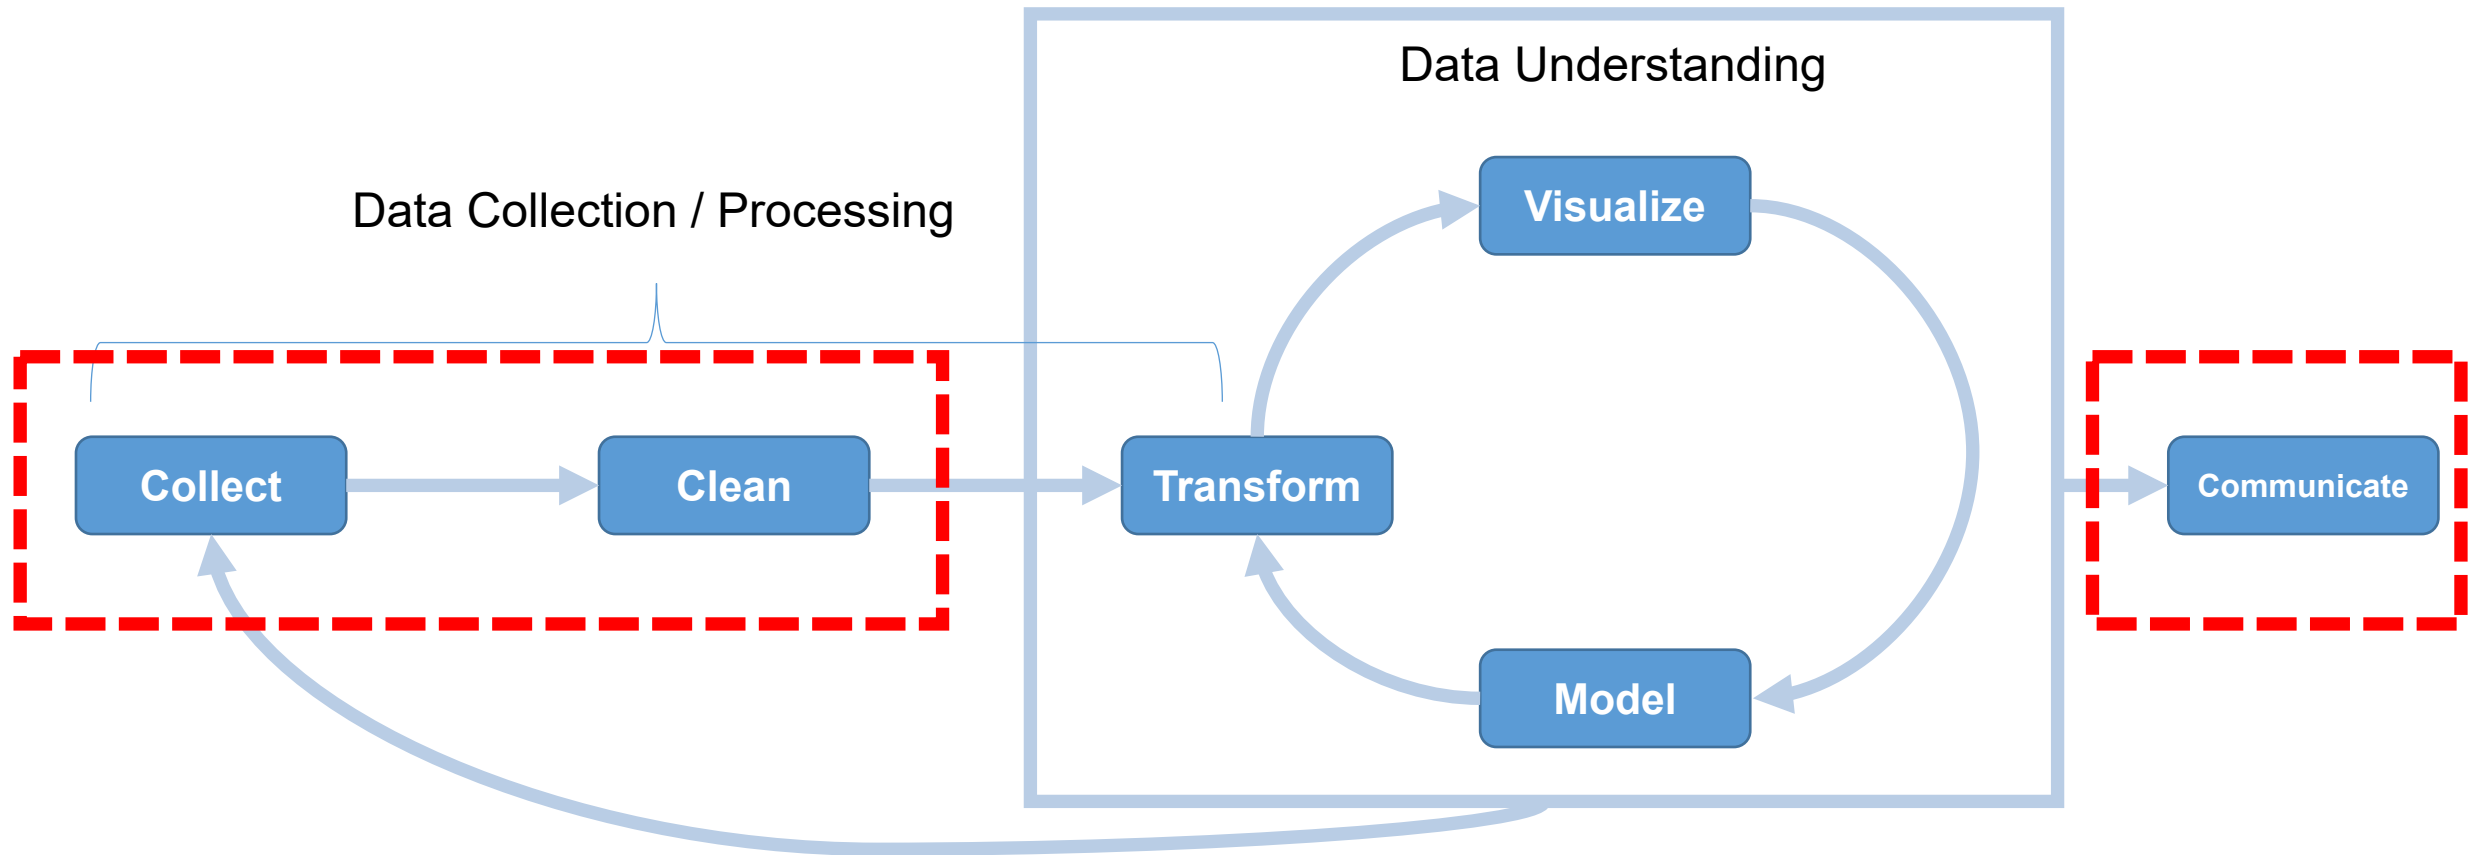

Data Science Is:

- **Interdisciplinary:** Combines tools and techniques from Math / Statistics / CS
- **Exploratory:** Understanding data requires creative exploration and visualization
- **Applied Statistics & Probability** + extra stuff to handle, process, and visualize data

Data Science Workflow

Data Science Workflow

Only touched on these briefly...

Course Overview

Course Objective Introduction to basic concepts in data science and machine learning.

Probability and Statistics	Data Handling and Visualization	Machine Learning	Ethics and Fairness
Random events / variables, distributions / densities, moments, descriptive stats, estimation	Reading & cleaning, transformation & preprocessing, visualization	Predictive models, supervised learning, unsupervised learning, model checking	Data privacy, ethics, fairness

Probability and Statistics

Suppose we roll two fair dice...

- What are the possible outcomes?
- What is the *probability* of rolling **even** numbers?

... this is an **experiment** or **random process**.

We learned how to...

- Mathematically formulate outcomes and their probabilities?
- Describe characteristics of random processes
- Estimate unknown quantities (e.g. are the dice actually fair?)
- Characterize the uncertainty in random outcomes
- Identify and measure dependence among random quantities

Data Handling and Visualization

In Data Handling learned to...

- Collect data through population sampling
- Identify and avoid biased population samples
- Clean data and correct errors
- Transform and preprocess data (*wrangling*)

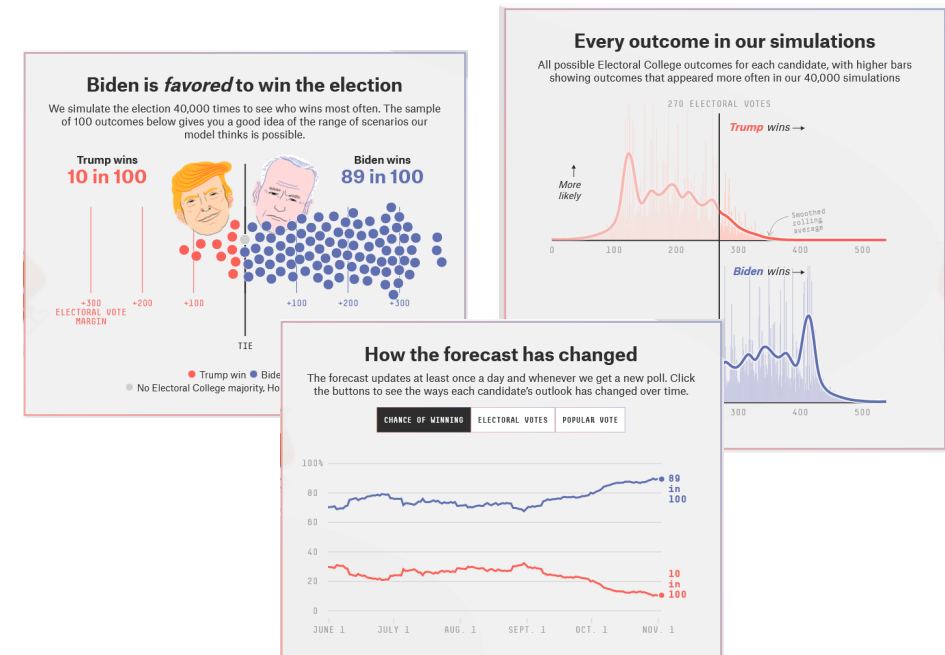

DATA

[Image Source: Code A Star]

In Data Visualization we learned...

- Why visualization is important
- Exploratory data analysis
- Common forms of visualization
- Pitfalls and gotchas

Machine Learning

How do use data to learn underlying patterns and predict unknowns?

In Machine Learning we learned...

- Principles of prediction
- Use of training / validation / test data
- Unsupervised vs. supervised learning
- Linear and nonlinear models

DRIVEN DATA

- Focuses on social impact
- Challenges last 2-3 months
- Real-world predictive problems
 - Detecting hateful content online
 - Predicting disease spread
 - Predicting damage from earthquakes
 - ...
- Submissions are released as open source

The screenshot shows a competition card for 'Pump it Up: Data Mining the Water Table'. At the top, there is a technical diagram of a water pump with labels: 'Water outlet', 'Force rod', 'Piston rod', 'Cylinder', 'Piston', 'Check valve', 'Sealing O-ring', 'Check valve', and 'Water suction line'. A blue heart icon is in the top right corner. Below the diagram, the title 'Pump it Up: Data Mining the Water Table' is displayed. Underneath, it says '7 MONTHS, 3 WEEKS LEFT'. The description reads: 'Can you predict which water pumps are faulty to promote access to clean, potable water across Tanzania? This is an intermediate-level practice competition.' At the bottom left, there is a profile picture of a man named 'stepthom', labeled 'CURRENT LEADER'. To the right of the profile is a blue button that says 'COMPETE →'.

Outline

- Data Science Ethics and Fairness
- Course Recap
- Additional Resources
- **Final Exam Overview**

Final Exam

- Out Thursday 12 / 9, Due Wed 12 / 15 @ 11:59
- Worth 20 points total
- 3 Required questions (Jupyter notebooks)
- 1 Extra credit (written)

Final Exam

Question 1 : Data analysis and visualization

- Review Homework 5
- Load data / do some cleaning and preprocessing / display visualizations
- Review boxplots, scatterplots, pie charts

Question 2 : Linear / Nonlinear Regression

- Review Homework 7 and part of Homework 8 (PolynomialFeatures)
- Fit linear regression model
- Compute polynomial features
- Fit nonlinear regression

Question 3 : PCA + High-Dimensional Clustering

- Review PCA lecture and HW9
- Fit K-Means to high-dimensional dataset
- Fit PCA model to reduce dimensions
- Fit K-Means to reduced dimension model

Questions?
